WHAT IS AI?

AI, or Artificial Intelligence, is a broad term for machines that can perform tasks that typically require human intelligence

Popular Types Of AI

Computer Vision

- Facial recognition
- Image recognition
- Self-driving car detection
- Medical imaging

Predictive AI

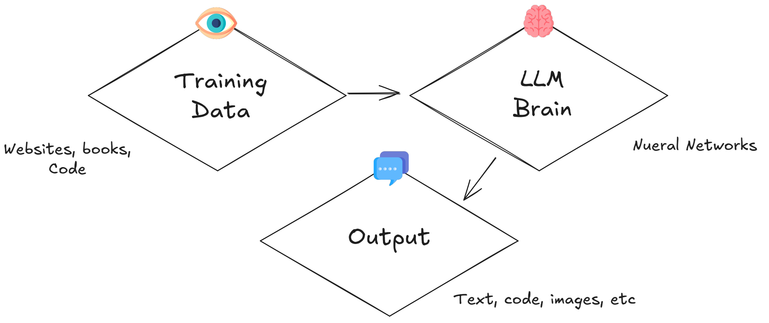
- Netflix recommendations
- CC fraud detection
- Stock forecasting
- Weather prediction

Generative AI

- Text generation (ChatGPT, Claude)
- Image generation (Midjourney, DALL-E)
- Code generation (Copilot, Cursor)
- Audio/voice generation (Elevenlabs)
- Music generation (Suno, Runway)
- Video generation (Sora, Udio)

LLM (Large Language Model)

Prediction machine trained on massive amounts of text



LLM Training

Model ingests massive datasets. Learns language patterns, facts, reasoning, structures

Pre-training → **Fine Tuning** → **RLHF**

Reinforcement Learning From Human Feedback
Humans rate the model response

Base model gets refined for specific tasks. Learns to follow instructions nicely

What LLMs Are Good At

- Explaining concepts in plain language
- Writing and editing text
- Generating code in pretty much any language
- Answering questions and providing information
- Brainstorming and ideation
- Translating between languages
- Summarizing long documents
- Following complex instructions

Downsides & Misconceptions

- They hallucinate
- They don't actually "know" anything
- They can't learn during a conversation
- They have knowlege cutoffs
- They're not reasoning the way humans do

Key Players

Open AI · Anthropic · Google · Meta
